

Task Scenario Details

1. Explore the Area (Navigate to Location B)

Navigate to the radiation source location. Minimize collisions and maintain proximity between drone and ground robot for coordinated movement.

2. Find the Radiation Source

Drone: Use the radiation sensor to identify which sphere is emitting radiation (randomized per session)

Ground Robot: Once radiation source is detected, approach the corresponding valve and press the spacebar to automatically turn it off to deactivate it.

3. Search for the Rescue Dummy (Location C)

Navigate to the dummy at Location C. Ground robot should position itself for optimal retrieval while drone provides visual support.

4. Carry the Dummy to Safety (Location A)

Drone: Maintain visual guidance for the ground robot to minimize collisions.

Ground Robot: Grab the dummy with the spacebar (at close range), then reverse toward the safety zone. Try moving the dummy backward, not forward.

5. Task Complete

Congratulations! Radiation source is turned off and dummy is rescued.
